Medical diagnoses in which the medical professional also utilized a dermatoscope-- a handheld magnifying glass and light-- were even more accurate than those made without the gadget.

Common Lesions and Disorders of the Skin

The skin is the largest organ of the human body. The outermost layer, the **epidermis**, protects the body from injury, excessive water loss, and invasion by disease-causing microorganisms. The innermost layer, the **dermis**, contains blood vessels, glands, and nerve endings that respond to changes in temperature, pressure, and pain. Beneath the dermis lies a layer of subcutaneous tissue that contains adipose (fat) and connective tissue to cushion the body, maintain heat, and store energy.

Hair, sebaceous glands, and nails are all derivatives of the skin. These structures are derived from specialized areas of the epidermis that grow down into the dermis.

NORMAL ANATOMY

Dermatologists use the Fitzpatrick scale to categorize different skin tones based on the how easily the skin burns or tans when exposed to ultraviolet radiation and thus reflects the amount of melanin—the dark pigment made by special cells—present in the skin. These skin tones are used as an objective measure of skin tone.

I	II	III	IV	V	VI
Pale white; Always burns	White to light beige Burns easily; minimal tan	Beige Burns moderately; sometimes tans	Light brown Burns minimally; tans easily	Moderate brown Rarely burns; tans to dark brown	Dark brown or black Never burns; tans very dark
