The principle is simple. A gamer sets a target multiplier (e.g., 2.00 x, 10.00 x, or perhaps 1000.00 x). The game's algorithm then produces a random multiplier. If the produced multiplier is **equivalent to or higher** than the gamer's target, the bet wins. If it falls short, the bet is lost.

Since of its provably reasonable algorithms and high customization, Limbo has actually become a staple offering throughout almost all major crypto-friendly betting platforms.

3. **Check the Win Chance:** As the gamer changes the target multiplier, the game user interface immediately determines the analytical possibility of winning (Win Chance %) based on the house edge.
4. **Hit "Bet" or "Play":** The round carries out immediately. A random number is produced in milliseconds, displaying the outcome on the screen.

Understanding the Mechanics: House Edge and Probability

Behind Limbo's basic user interface lies accurate mathematics. The game relies greatly on probabilities, and understanding these numbers is crucial for any gamer seeking to handle their bankroll efficiently.

In many versions of Limbo, the **home edge** ranges in between **1% and 2%**. This means that over the long term, the gambling establishment retains a [Discover more](#) small percentage of all wagers.

The relationship between the target multiplier and the win opportunity is inversely proportional. As the target multiplier boosts, the win opportunity decreases substantially.

Example Limbo Multiplier vs. Win Chance Table (Based on a 1% House Edge)

Target Multiplier	Statistical Win Chance	Potential Payout on £ 10 Bet
1.05 x	94.28%	£ 10.50
2.00 x	49.50%	£ 20.00
5.00 x	19.80%	£ 50.00
10.00 x	9.90%	£ 100.00
50.00 x	1.98%	£ 500.00
100.00 x	0.99%	£ 1,000.00
1,000.00 x	0.099%	£ 10,000.00

As highlighted in the table, setting a target of 2.00 x gives the player roughly a 50% chance of doubling their cash (minus the house edge), while going after a 1,000.00 x multiplier drops the chances to less than one in a thousand.
