Platforms usually use two main modes of play:

1. **Player vs. Player (PvP):** Users deposit funds into an escrow account, challenge another player, and toss their indications. The blockchain or platform smart agreement quickly distributes the payouts to the victor.

2. **Player vs. House:** Players bet versus the house. To keep the video game reasonable, trusted platforms use Provably Fair algorithms, making sure the house can not cheat the result of a toss.

Payouts and House Edges

Because Rock Paper Scissors is a zero-sum game with 3 equal results, a level playing field has a stringent mathematical expectation. Nevertheless, platforms need to generate income to run.

Platform Type Normal House Edge/ Rake Mechanism **Traditional Crypto Casinos** 1%-- 3% House acts as the opponent or handles the RNG. **P2P Escrow Platforms** 2%-- 5% Takes a small portion cost (rake) from the overall pot. **Smart Contract (Decentralized)** 0.5%-- 1% Automated by blockchain code; minimal functional overhead.

Behavioral Patterns Table

Round Outcome Human Tendency Ideal Counter-Strategy **You Win** Opponent most likely to change to what beats your last relocation. Toss the sign that beats their expected switch. **You Lose** Challenger most likely to repeat their winning move. Throw the indication that beats their previous winning relocation. **Connect** Both players experience cognitive dissonance and often switch right away. Anticipate a switch and pick appropriately.

3. Combined Strategy Nash Equilibrium

In video game theory, the only unequalled strategy in a pure game of Rock Paper Scissors is the **Nash Equilibrium**. This implies playing Rock, Paper, and Scissors with a totally randomized 33.3% distribution over the long term.
