

# RECOGNIZING SKIN CANCER

If a mole looks just like it has for the last 20 years, it's probably benign. The most important thing to look for is a change: a new spot, a mole that is growing or changing color, a sore that doesn't heal.

**THE ABCDE'S OF MELANOMA, THE FORM OF SKIN CANCER THAT IS MOST LIKELY TO METASTASIZE, OR SPREAD ALL OVER YOUR BODY:**

## ASYMMETRY

A spot that's irregular, instead of being round

## BORDER

An uneven border, or a ragged edge

## COLOR

Uneven color, with different shades of black and brown

## DIAMETER

Larger than a pencil eraser

## EVOLVING

Changes in size, color, or thickness

**Other forms of skin cancer can also take different appearances:**

A red, scaly patch (large or small) that won't clear up or keeps coming back

A skin-colored bump that grows slowly

A sore that won't heal

A "growing scar" – a firm, recessed spot, either skin-colored or lighter  
Melanomas and non-melanoma cancers can be either raised or flat.

The most important thing is to be familiar with your own skin and recognize changes when they occur. If you see any new, growing, or odd-looking moles, contact us right away for an appointment.
